### **“IEEE-CBP-FDP-Blockchain technology: Future of cyber security”**

#### **Introduction:**

In cybersecurity, blockchain and artificial intelligence (AI) are two gamechangers. Blockchain and artificial intelligence (AI) can help protect companies and individuals from digital threats by providing secure and transparent methods of storing and communicating sensitive information, as well as automating procedures and detecting abnormalities. The usage of private and public keys is an important feature of privacy in blockchains. Asymmetric cryptography is used by blockchain systems to safeguard transactions between users. Blockchain technology generates an intrinsically secure data structure. It is built on cryptographic, decentralized, and consensus concepts that ensure transaction trust. By decentralizing system or device administration, blockchain can help to increase IoT security. By 2030, public and commercial efforts in security technology are likely to produce major results. Cybersecurity will change from defending fortresses to recognizing persistent cyber danger and focusing on resilience and recovery capacity.

#### **Objectives:**

- To introduce fundamentals of Blockchain technology and implementations of Blockchain technology.
- To disseminate the knowledge of cryptocurrencies function both as a currency and as a virtual accounting system.
- To promote the development, deployment, and the practical usage of blockchain technologies with respect to cyber security.
- To provide hands-on sessions in Cyber Security and Blockchain System

#### **Outcomes:**

- Sound fundamental knowledge in blockchain technology along with research challenges
- Enable the academicians to add another dimension to their teaching for industry ready.
- Insights into solving real life problems by Blockchain and cybersecurity Experts from Industry
